```
public class MultiplicationTable { public static void main(String [] args) { int num = 9, i = 1; while(i <= 10) { System.out.printf ("%d * %d = %d \n", num, i, num * i); i++; } } }

The String type is so much used and integrated in Java, that some call it "the special ninth type". A String in Java is actually a non-primitive data type, because it refers to an object. The String object has methods that are used to perform certain operations on strings.

Example.

```
interface Animal { public void animalSound(); public void sleep(); } class Pig implements Animal { public void animalSound() { System.out.println("The pig says: wee wee"); } public void sleep() { System.out.println("Zzz"); } } class MyMainClass { public static void main(String[] args) { Pig myPig = new Pig(); myPig.animalSound(); myPig.sleep(); } }

Example explained. Statement 1 sets a variable before the loop starts (int i = 0). Statement 2 defines the condition for the loop to run (i must be less than 5). If the condition is true, the loop will start over again, if it is false, the loop will end. Statement 3 increases a value (i++) each time the code block in the loop has been executed.

Get and Set. You learned from the previous chapter that private variables can only be accessed within the same class (an outside class has no access to it). However, it is possible to access them if we provide public get and set methods.. The get method returns the variable value, and the set method sets the value.. Syntax for both is that they start with either get or set, followed by the ...

For example, `x = 7 + 3 * 2`; here `x` is assigned 13, not 20 because operator `*` has higher precedence than `+`, so it first gets multiplied with `3 * 2` and then adds into 7. Here, operators with the highest precedence appear at the top of the table, those with the lowest appear at the bottom.

In this case, the Java compiler automatically specifies the size by counting the number of elements in the array (i.e. 5). In the Java array, each memory location is associated with a number. The number is known as an array index. We can also initialize arrays in Java, using the index number. For example,
