Lab #7 - Seedless Vascular Plants 1 Lab #7 Seedless Vascular Plants Introduction In today’s lab, we will study seedless vascular plants. This plant group evolved by the late Devonian period and was the prominent group during the Carboniferous period of the Paleozoic era. They formed the first forests about 385 million years ago. These forests are the main source of fossil fuels we use today.

Lab #7 - Seedless Vascular Plants.pdf - Lab#7 Seedless ...

Seedless Labs. We are a small lab located just 30 minutes north of Boston, Massachusetts. We aim to be the most accessible tissue culture lab in New England. Our lab allows easy access for Massachusetts, Maine, Vermont, and Rhode Island. Close to a main airport making it available for everyone around the United States.

Seedless Labs

1. Are these leafy plants like Selaginella part of the sporophyte or gametophyte generation? 2. What features would you look for to determine if a plant is a seedless vascular plant? 3. Are the microspores and megaspores produced by mitosis or meiosis? (REFER to diagram 15.2 in your lab manual.) 4.

•Define the seedless vascular Divisions. 1. Nonvascular plants: Bryophyta (mosses), Hepatophyta (liverworts), and Anthoceraphyta (hornworts) These all tend to be small terrestrial plants with some tissue differentiation but lacking conducting (vascular) tissue. All have an alternation

LAB: Bryophytes and seedless vascular plants (except ferns)

Seedless vascular plants (SVPs) also began to rely more on the sporophyte stage. The sporophyte became the larger, nutritionally independent stage of the life cycle. Branching sporophytes offered more sites for meiosis to occur, resulting in increased opportunities for variation, which could be interpreted as more options in an increasingly competitive environment.
